REPORT SUMMARY

The drinking water for the City of Surrey is provided by the Greater Vancouver Water District, which falls under the jurisdiction of Metro Vancouver. The urban water distribution system spans approximately 1876 kilometers, marking it as British Columbia's most extensive network. The system includes 30 distinct pressure zones and is supported by nine pumping stations.

In order to preserve the quality of water in the distribution network, the City employs a unidirectional flushing strategy to clean all water mains. The goal of this program is to systematically flush the entire municipal water distribution system every five years. Water quality assessments are performed at 51 different sampling sites. Every week, samples are gathered and examined by Metro Vancouver. The evaluations cover bacterial content, chlorine residue levels, pH value, water temperature, and clarity measurements.

In the analysis of 3,135 water samples conducted in 2023, E-coli bacteria were not found. While ten samples initially showed the presence of total coliform bacteria, further testing after flushing the system confirmed negative results.

In cases of water quality concerns or infrastructure malfunctions like water main breaks, the City adheres to established response protocols. These include specific measures for repairs and ensure coordination among the City, Metro Vancouver, and the Fraser Health Authority.

Monitoring of chlorine levels is consistently performed across the water distribution network. In 2023, a total of 3135 samples were collected, with 84% registering chlorine concentrations above 0.2 mg/L, marking a 7% decline from the previous year's figures. In instances where elevated heterotrophic plate counts (HPC) occur due to diminished chlorine residuals and circulation issues, operational staff conduct flushing operations in the affected zones to refresh mainline water and enhance chlorine residual levels. Efforts to ameliorate low flow regions are ongoing, including the integration of dead-end mains through looping, which helps boost water movement in these areas. Moreover, the city procures quarterly samples to test for disinfection by-products like Haloacetic Acids and Trihalomethanes and conducts biannual assessments for pH levels and metal content. Test outcomes align with the Guidelines for Canadian Drinking Water Quality established in 2022.

In 2023, there have been no instances of tampering or vandalism reported within the municipal water system. Security measures for the system include lighting, locking mechanisms, and alarm systems at pump locations, in addition to backflow preventers installed on service connectors. Additionally, the City has a program in place to prevent contamination from improper connections called the cross connection control program.

In the year 2023, there were 615 new backflow preventers that were registered for testing with the City. The cumulative total of registered assemblies reached 16,542, marking a 3.8% growth compared to the previous year. These devices have been fitted as part of new construction, renovation projects, or due to the requirements of cross-connection control surveys. It's mandatory for these assemblies to undergo testing annually. The City monitors and ensures that institutional, commercial, and industrial (ICI) operations comply with the Surrey Waterworks Cross Connection Control By-law, 2013, No. 17988.

Surrey continues to uphold rigorous standards in its water distribution maintenance, guaranteeing that residents and businesses receive superior quality water.

2023 WATER SYSTEM ANNUAL REPORT

A. System Makeup

Surrey's water supply comes from the Greater Vancouver Water District (GVWD). The water is sourced from precipitation and snowmelt that is stored in three reservoirs located on the Capilano, Seymour, and Coquitlam rivers. Monitoring, treating, and distributing this water to its member municipalities is handled by Metro Vancouver. The treatment process eliminates all pathogens. To ensure no microbial regrowth, secondary chlorination is applied before the water enters Surrey's network. After this point, the water goes through no additional treatment within Surrey's distribution system. A visual representation of the distribution system can be seen in Figure 1 on page 2. For an in-depth look at the water main details, refer to Table 1 on page 3, titled "City of Surrey 2023 Water Main Inventory".

With roughly 1876 km of water distribution mains, the City boasts British Columbia's most expansive distribution network. The system consists of components such as pump stations, mains, pressure valves, sampling stations, service connections, and meters. In 2023, service connections grew by 0.3% (281), reaching a total of 95,919. Surrey's population estimate stood at 603,970 as of 2022.

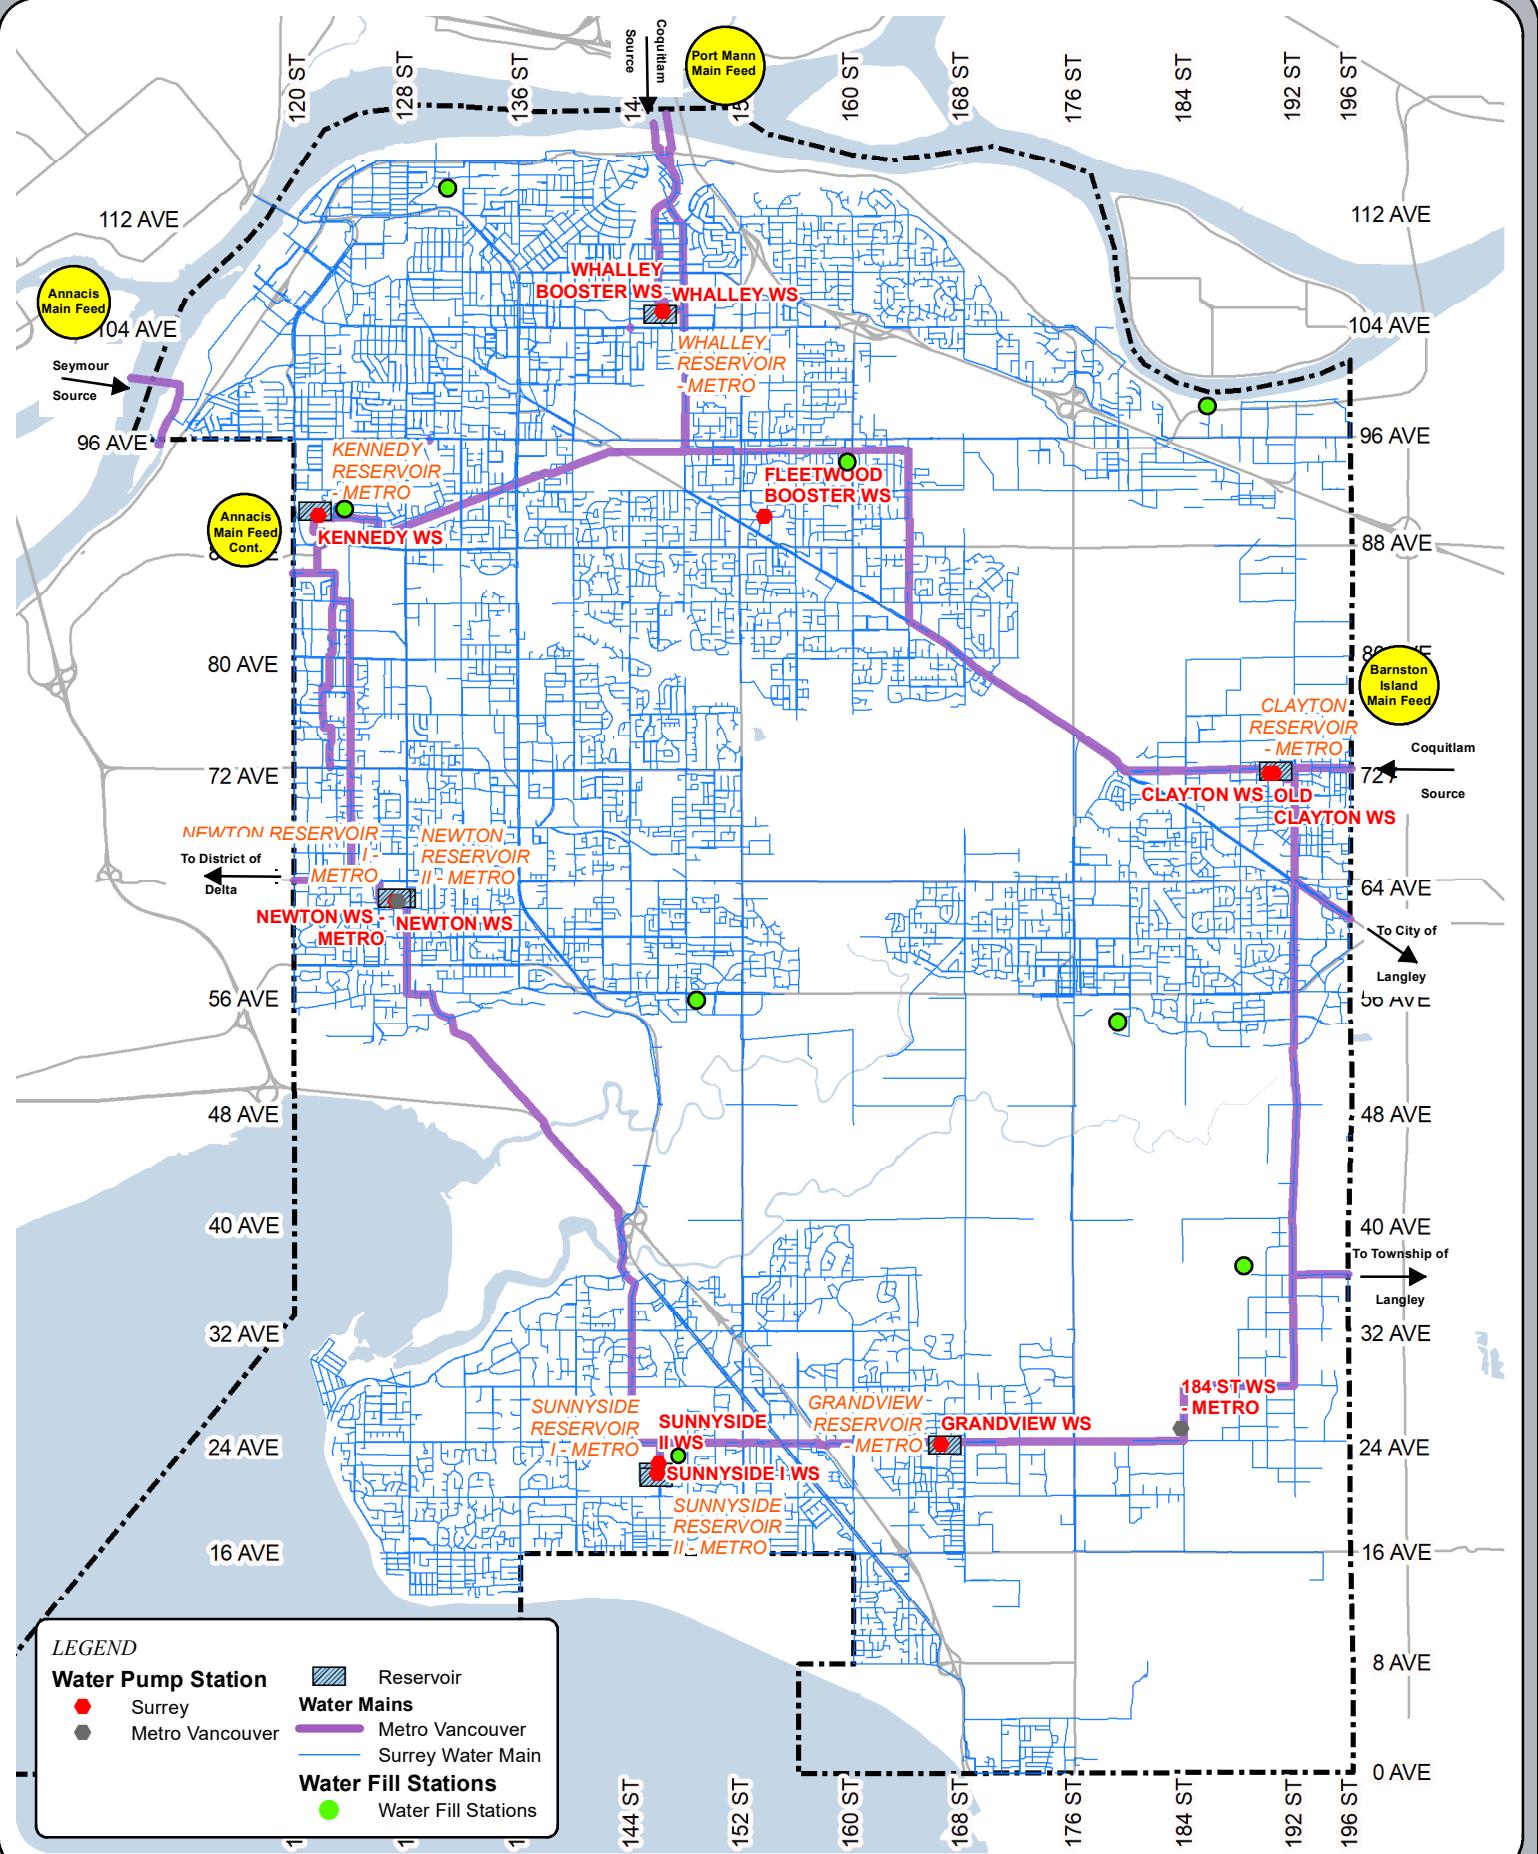

To illustrate 1876 km of water main, this would be from Surrey to approximately 145 km east of Regina Saskatchewan

By employing pressure reducing valves, pumping stations, closed valves, check valves, the distribution system is divided into 30 distinct pressure zones. The pressure in each zone is adjusted according to the area's topography to ensure adequate water pressure for all residents.

The urban layout features numerous dead-ends due to the boundaries of pressure zones, cul-de-sacs, extended water mains in thinly populated country regions, and natural barriers like gullies, streams, coastlines, and flood areas. Whenever water quality concerns occur in these locales, municipal teams address them by flushing the mains.

The municipality provides eight water fill stations for construction firms to access water. These stations reduce reliance on fire hydrants to fill tankers and enable the City to track water usage. Where feasible, these stations are placed on dead end mains to enhance flow and better water quality in those zones.

B. System Maintenance

Surrey's water distribution system is managed and maintained by 55 employees. Of these, 38 hold EOCP certifications, with 17 at WD I level, 19 at WD II, and 2 at WD III.

The water operations organization structure is shown in Figure 2 (below).

Figure 2:
City of Surrey Water Operations Organizational Chart

The duties and responsibilities of the various crews and staff members are as follows:

a) Water Operations Superintendent

Oversees the work of Operations Crews and offers technical support, as well as guidance on the maintenance and expansion of distribution systems.

b) Engineering Project Coordinators

Offer support in both technical and administrative capacities to the Operations Teams and their Supervisors. Aid in managing data, conducting research, and perform any tasks assigned by the Water Manager.

c) Land Development Servicing

Handles the installation and renewal of both domestic and fire line services across the city.

d) Infrastructure Repairs and Maintenance

Upholds water services, mains, and connected components. Delivers urgent repairs for the water system when necessary. Engages in proactive and responsive work to find and repair leaks. Aids in precisely pinpointing the location of identified leaks.

e) Water Main Tie-ins

Links new mains to established ones, oversees the tie-in work performed by private contractors, and documents the specifics of the construction process.

Water Main Tie in at 145 St & 109 Ave

f) Water Quality & Hydrants

Conducts regular and as-needed flushing of municipal water mains, performs chlorine residual tests and bacteriological assessments on active and new city mains when required, and carries out maintenance on fire hydrants.

g) Water Meter Reading and Maintenance

Manages the entire scope of water meter functions, catering to residential, business, institutional, and industrial establishments. The program encompasses inspections, maintenance, calibration, replacement, and recording of meter readings.

C. Flushing Maintenance

The City upholds the quality of water within its distribution network by implementing a yearly unidirectional flushing schedule, ensuring that all mains are flushed at minimum once within a five-year cycle. The flushing process clears out any standing water and sediment build-up inside the pipes. Additionally, the City performs "on-demand" flushing when necessary, typically in response to line repairs or the outcomes of water quality assessments.

On page 7, Figure 3 titled "Unidirectional Flushing Program" illustrates the areas of water service that underwent flushing. In 2023, a total of 533 kilometers of mains were flushed, representing 28% of the entire length of mains.

Flush operations are often scheduled during the fall and spring to bypass the high water use periods of summer. Uni-directional flushing begins at the primary source within a service area and progresses through successive downstream hydrants, which prevents water from unflushed mains from mixing with that from flushed mains. The dechlorination of water expelled through fire hydrants is performed to adhere to the Ministry of Environment standards for discharge into water bodies.

As the City generally does not face limits on pipeline flow, abrasive cleaning techniques like pigging and swabbing are not employed. When water mains near the end of their viability, they're substituted in accordance with prevailing pipe material specifications and fire flow criteria.

Typical set-up for water main flushing

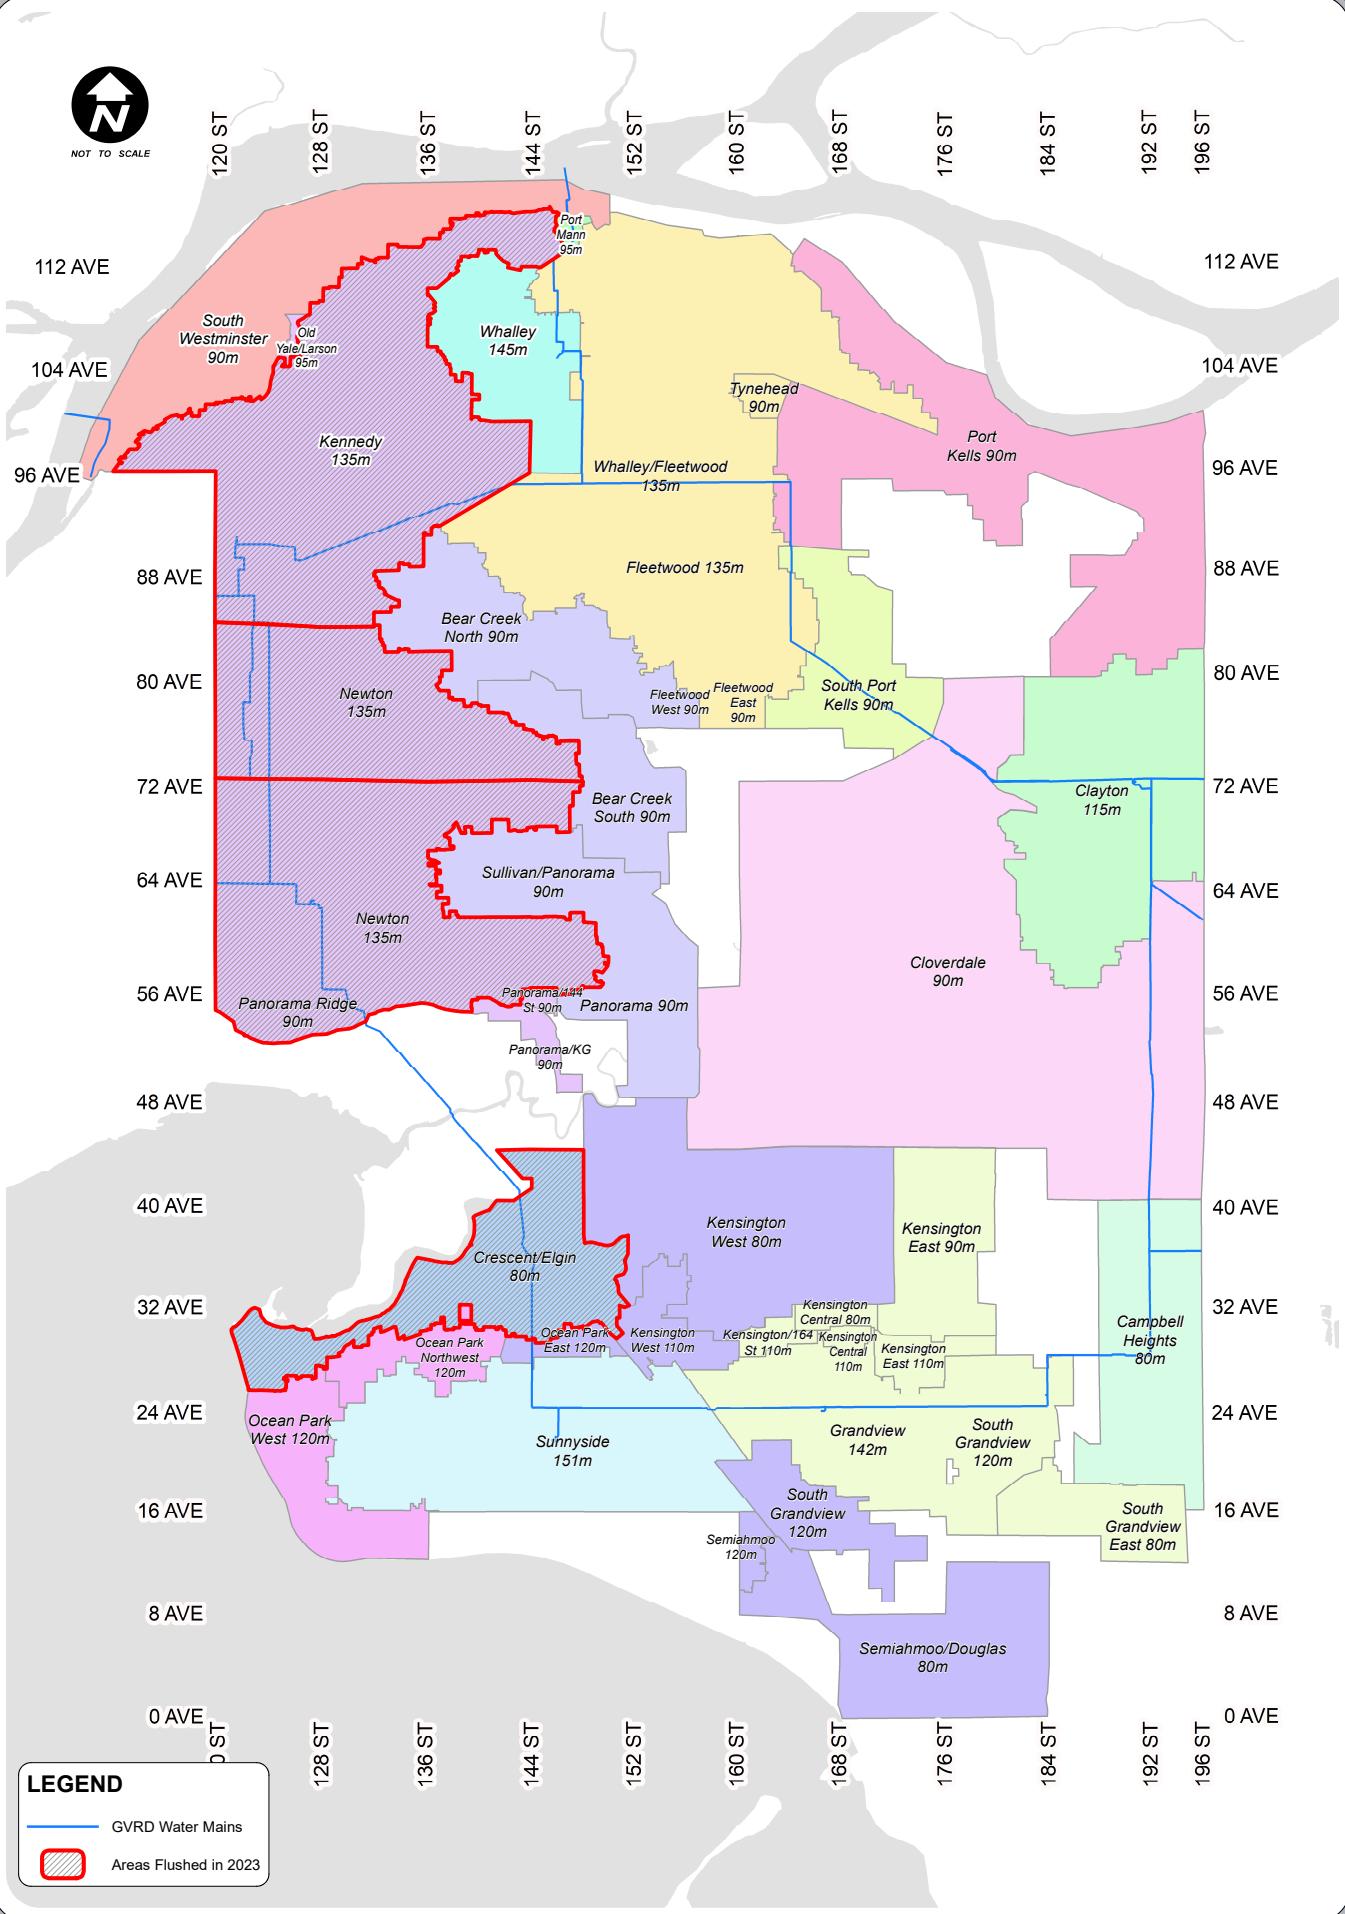

FIG 3: UNIDIRECTIONAL FLUSHING PROGRAM - 2023

D. System Budget

Table 2 (below) outlines the summary of activities and yearly budgets dedicated to maintaining water quality. The 2024 budget accounts for 21% of the City's yearly Water Utility Operations & Maintenance budget, with the other 79% allocated for managing the City's water valves, meters, service connections, operational support services, and electricity for the water pump stations.

Table 2: City of Surrey Water Quality Maintenance Budgets 2023 and 2024

Description	2023 Budget	2024 Budget
Main Line Repairs	\$600,263	\$627,654
Line Flushing	\$422,380	\$440,794
Hydrant Repair/Maintenance	\$792,727	\$821,895
PRV Maintenance	\$254,854	\$254,976
Pump Stations Maintenance	\$580,806	\$562,869
Water Quality Monitoring	\$85,696	\$85,696
TOTALS*	\$2,736,999	\$ 2,793,884

* Total Water Distribution System Operations & Maintenance Budget
is: \$12,630,000 for 2023, and \$13,085,262 for 2024.

E. Water Sampling & Testing Program

The City's water quality is checked at 51 sites where Metro Vancouver staff collect samples weekly. The laboratory, sanctioned by the Provincial Health Officer for bacteriological tests and accredited by CALA, assesses various components such as metals, THMs, coliforms, and E. coli. Details of these sites can be found in Figure 4 on page 10 and their locations in Figure 5 on page 11. Weekly testing data for 2023 is provided in Appendix A.

In accordance with the B.C. Drinking Water Protection Regulation, under Schedule B, the City's minimum requirement for monthly sampling is set at 137. The City of Surrey exceeds this requirement, averaging 252 samples each month. For a detailed breakdown of the sampling frequency at individual stations, please refer to Appendix A, titled "2023 Sampling Station Results."

Water Sampling Station at 148 Street

In 2023, E-coli bacteria were not found in any of the 3135 water samples examined. There were ten instances of total coliform bacteria found, all at separate sampling locations, but no further evidence of coliforms was found upon retesting. Along with tests for bacteria, pH levels, Haloacetic acids (HAA5), Trihalomethanes (THMs), and metals are also monitored. The water system's quality has met the standards established in the Guidelines for Canadian Drinking Water Quality found in Appendix A.

The pH levels were tested four times a year at three different monitoring points, yielding an average of 7.8. These findings can be found in Appendix A titled "2023 DBP Data". In June 2021, Metro Vancouver started a corrosion control strategy by raising the pH and alkalinity of drinking water with natural mineral additives. This initiative aims to minimize pipe leaks due to copper erosion and extend the durability of plumbing systems and water heaters. Additional details are available through Metro Vancouver's online resource:

<http://www.metrovancouver.org/services/water/engagement/projects-and-initiatives/corrosion-control-program/Pages/default.aspx>

The average THM disinfection by-product levels were 47 parts per billion (ppb) across seven sampling locations. The complete test outcomes can be found in Appendix A, titled "2023 DBP Data."

The average level of HAA5 disinfection by-products was measured at 28 parts per billion across seven sampling sites. Detailed test outcomes can be found in Appendix A, entitled "2023 DBP Data."

Analysis of metals such as copper, iron, lead, zinc, chromium, and manganese was conducted in March and October at three different locations. The findings are presented in Appendix A, titled "2023 Semi-Annual Metal Analysis."

No traces of vinyl chloride were found at the four testing locations during the June and November samplings. The findings can be reviewed in Appendix A, titled "2023 Vinyl Chloride Results."

Since the source water comes from a protected watershed that is free from pesticides and herbicides, and is transported to the City through a sealed pipe system from Metro Vancouver, there is no testing for these substances.

F. Water Quality Inquiries

In 2023, City teams addressed 365 water quality concerns reported, marking an uptick of 84 compared to 2022. The following chart shows the issues brought up in 2023 alongside comparisons with past years.

Chart 1: Water Inquiries

Turbidity problems can occur from abrupt changes in water flow within a distribution system caused by valve usage, firefighting activities, or power outages at pump stations. Typically, these issues can be resolved rapidly by flushing the system.

Flavor and smell sensitivities can arise from trace amounts of chlorine residual in the system for some individuals. To mitigate this, one can store water in an open container in the refrigerator or employ a charcoal water filter. Additional taste and odor issues may stem from stagnant water, which can be addressed through system flushing.

Cloudy water occurs when the speed of water flowing through our system rises, trapping air bubbles that are safe. If you fill a glass with this water, it will become clear from the bottom up in a few minutes.

Additional concerns can arise such as a pink hue on fixtures or white particles in the hot water, which stem from problems with the internal plumbing. Tiny stones and sand often originate from a disruption in the water service or mains. Flushing usually eliminates these particulates.

The Water Info category addresses public queries about water quality in Surrey, including water testing, sampling, and issues related to lead. This category ensures adherence to the Guidelines for Canadian Drinking Water Quality.

Based on Surrey's projected population of 603,970 in 2022, there's a response rate for water quality concerns at about 0.06%, which equates to roughly 6 inquiries for every 10,000 customers.

³ Surrey Population (2022) 603,970 Population Estimates and Projections, <https://www.surrey.ca/business-economic-development/business-data/population-estimates-projections>

G. Water Quality Response Notification

The City, together with Metro Vancouver and its member municipalities, and FHA, have established a notification protocol for instances that impact water quality. This protocol is followed by the City in cases of line breakages or suspected contamination. Additionally, if E. coli bacteria are found, the City informs FHA via Metro Vancouver's testing lab. The details of this procedure are presented below.

Water Quality Response Procedure

Situation	Notifying Agency	Agency Notified	Time Frame for Notification
Metro Vancouver E. Coli Positive Sample	Metro Vancouver	Metro Vancouver, MHO, City of Surrey	Immediate
Municipal E.Coli Positive Sample	Laboratory ² City of Surrey ³	MHO (or delegate)	Immediate
Chemical Contamination – Metro Vancouver	Metro Vancouver	Metro Vancouver, MHO, City of Surrey ¹	Immediate
Chemical Contamination – City of Surrey	City of Surrey	MHO (or delegate)	Immediate
Turbidity \geq 5NTU	Metro Vancouver	Metro Vancouver, MHO, and City of Surrey ¹	Immediate
Disinfection Failure – Source Water (Primary Disinfection)	Metro Vancouver	Metro Vancouver, MHO, and City of Surrey ¹	Immediate (As per DWPA)
Disinfection Failure – Rechlorination (Secondary Disinfection)	Metro Vancouver	Metro Vancouver, MHO, and City of Surrey ¹	Immediate, in any situation in which the BCDWPR or the GCDWQ may not be met.
Loss of Pressure Due to High Demand	City of Surrey	MHO (or delegate), Metro Vancouver	Immediate
Line Break – City of Surrey⁴	City of Surrey	MHO (or delegate)	As soon as possible
Line Break – Metro Vancouver⁴	Metro Vancouver	City of Surrey	Optional

Line Break – Metro Vancouver⁵	Metro Vancouver	Metro Vancouver, MHO, City of Surrey ¹	Immediate

¹City of Surrey to notify Fraser Health Authority.

²Laboratory to immediately notify the MHO, DWO (or FHA delegates) and the water supplier as per section 12(1) of the DWPA.

³City of Surrey to immediately notify the MHO, DWO (or FHA delegates) as per section 12(2) of the DWPA.

⁴With no suspected contamination.

⁵With suspected contamination.

H. Water Quality Test Results

While ten samples initially showed the presence of total coliform bacteria, subsequent testing following system flushing and re-sampling indicated no contamination. E-coli bacteria were not detected at any stage. Furthermore, water quality is regularly assessed using key indicators such as heterotrophic plate counts (HPC), chlorine residuals, and turbidity.

The growth of harmful bacteria may be encouraged by rising levels of HPC and turbidity alongside falling chlorine residuals. The City undertakes flushing and additional sampling if HPC test results exceed 500 heterotrophic bacteria colonies per milliliter. Such instances are more common in warmer seasons within areas of low circulation or at dead ends in the water distribution network.

In the year 2023, it was found that 1.6% of the tested samples had heterotrophic plate counts (HPCs) exceeding 500 colony forming units (CFU) per milliliter. This issue was addressed by performing flushing and elevating the levels of chlorine residuals. Table 4 presents a summary of cases with HPCs over 500 CFUs spanning from the years 2013 to 2023, as detailed on page 18. Additionally, these occurrences are depicted in a chart for the same duration on page 19.

As demonstrated on page 16 in Figure 6, titled "Chlorine Residuals," chlorine residual levels are tracked throughout the distribution network. The target minimum concentration has been set at 0.2 mg/L. Across the city, it was observed that 84% of the chlorine residual measurements exceeded 0.2 mg/L, as detailed in Table 3 on page 17. Chlorine analyzers have been put in place at the municipality's water pumping stations to maintain real-time tracking of the chlorine residuals emitted from the reservoirs.

The City is observing regions with low chlorine levels and high HPC counts (>500 CFU/ml) to find a viable solution for enhancing water quality, potentially by connecting dead-end mains.

**Graph 1: Comparison of Annual HPC Results >500 CFU/ml
in the City of Surrey's Water System**

I. Water System Security

The distribution system's security is ensured through various strategies. Pump stations are equipped with external security lights, secure access doors or ground hatches enclosed by fencing, and intrusion alarms connected to a SCADA monitoring system. In 2023, there were no instances of tampering or vandalism reported in the City's water system.

J. Backflow Prevention and Cross Connection Control

The City safeguards water quality by preventing backflow in the system, maintaining minimum pressures of 40 psi during peak use and 20 psi during emergencies such as fires or main breaks.

Furthermore, the City manages an extensive Cross Connection Control (CCC) program aimed at reducing the chances of pollutants from private properties contaminating the municipal water system and private plumbing networks. This program mandates yearly checks of backflow prevention devices, mandates the fitting of backflow preventers in new buildings (as part of plumbing permit regulations), and enforces a cross-connection survey requirement for existing industrial, commercial, and institutional (ICI) properties.

The City mandates yearly testing for back flow prevention devices. Property owners who fail to meet these requirements have received notifications to adhere to regulations or risk facing enforcement actions under the Surrey Waterworks Cross Connection Control By-law 2013, No. 17988.

As of 2023, there has been a 3.8% increase in the number of backflow preventers listed with the City, bringing the total to 16,542 units. Currently, 90% of these assemblies comply with regulations, down by 4% compared to the previous year.

The City of Surrey is committed to the meticulous upkeep of its water distribution network, guaranteeing that residents and businesses consistently receive water that meets superior quality criteria.

K. Water Emergency Response Plan

The management of water emergencies falls under the jurisdiction of both Metro Vancouver and the City of Surrey. Metro Vancouver (MV) is responsible for overseeing the transfer of source water from the North Shore watersheds to the supply mains in Surrey. In the event of an emergency caused by either human error or natural disasters, MV's Water Continuity Plan is activated. Similarly, any incidents occurring within Surrey's limits will trigger the activation of their own Water Continuity Plan. Emergency responses may deal with situations such as interruption of MV's water supply, the deterioration of water quality, and threats from earthquakes and floods. The City of Surrey regularly updates its plan to reflect the latest knowledge and best practices. In the process of updating and reviewing the plan, Surrey maintains close coordination with Fraser Health.

Better health.

Water System Operators

Re: Metals in Drinking Water – “Flush” Message in Annual Reports

Fraser Health has recently revised its metals at the tap “Flush” message and we are asking all water systems to please include the following health message with your next annual reports to your users.

Anytime the water in a particular faucet has not been used for six hours or longer, “flush” your cold-water pipes by running the water until you notice a change in temperature. (This could take as little as five to thirty seconds if there has been recent heavy water use such as showering or toilet flushing. Otherwise, it could take two minutes or longer.) The more time water has been sitting in your home’s pipes, the more lead it may contain.

Use only water from the cold-tap for drinking, cooking, and especially making baby formula. Hot water is likely to contain higher levels of lead.

The two actions recommended above are very important to the health of your family. They will probably be effective in reducing lead levels because most of the lead in household water usually comes from the plumbing in your house, not from the local water supply.

Conserving water is still important. Rather than just running the water down the drain you could use the water for things such as watering your plants.

If you have any questions, please contact our Drinking Water Program at 604-870-7903.

Sincerely,

Drinking Water Program
